

Job Configuration

Video 2.2

What you will learn in this video

- How to configure and run a job
- Core terminology:
 - Parameterized job
 - Build trigger
 - Build and post-build actions
 - Workspace
 - Artifact

Key Concepts

- **Workspace:** a working directory where code, builds, and other temporary files are stored during a build
- **Build trigger:** a criteria or a condition for triggering a build (e.g. time, code change, etc.)
- **Build step:** a task executed during the build process (e.g. shell script)
- **Post-build step:** additional task executed at the end of the build
- **Artifact:** an immutable file generated at the end of the build (jar/zip file)
